		• ClinicRx: <u>Summary:</u> Built a brand new healthcare website for a local business in the Hudson Valley that allows hospitals to send alerts to their constituent clinics and provide care to patients. <u>Steps:</u> (1) Engineered the frontend in React that features a real-time dashboard powered by a websocket connection. (2) Developed an EC2 Node websockets server that provides the backend for chat and real-time dashboard updates. (3) Created a AWS Lambda API server via a CloudFormation template and SAM utilities that manages database state via a MongoDB connection.

		Hybrid June 2025 – March 2026	
 CatFacts Built with: Python3, React	Cain Barberry LLC <i>Software Engineer</i>	Hybrid Oct 2023 – June 2025	
		• Email Marketing: (1) Built a custom email marketing program with Node and Google APIs that automatically visited all business websites within a specified 30 mile radius to gather professional email addresses. (2) Developed a React email template and Babel pipeline to transpile it to regular JavaScript and then to HTML with individualized data for each recipient. (3) Delivered large quantities of emails with AWS SES and performed customer service on responses. • Email Program Client: <u>Background:</u> The business is required by law to maintain 90 days of video from each of the 15 on-premise cameras that record footage 24/7. The system was broken. <u>Solution:</u> Architected a pattern to get the VideoInsight software to save the required 90 days of recordings to the local networked-attached storage device using their Windows machine.
